

Apply ssl client certificate validation policy

Custom policy for mule 4 to validate SSL client certificate parameters in HTTP headers

☐ Log Certificate Data

Select if the incoming certificate details should be logged for debugging purpose. The log entry will be in INFO mode.

Client Certificate Distinguished Name

The full Distinguished Name of the client certificate. This is optional and can be used for more strict validation in case if the API is for a specific consumer only.

Client Certificate Issuer

The full Distinguished Name of the issuing certificate. This is optional and can be used for more strict validation in case if the API is for a specific consumer only.

SSL-Client-Serial

Contains the serial number used by the CA to identify the client. This is optional and can be used for more strict validation in case if the API is for a specific consumer only.

Method & Resource conditions

- ☒ Apply configurations to all API methods & resources
- ☐ Apply configurations to specific methods & resources
